subject: route eval divergence

Kernel routing is correct under DEC-006; the eval used tags matching no authority.

Reading A prevails. DEC-006 forbids semantic authority matching: an authority is on-point only by a literal substring of the issue tag in its id, title, or summary. The two route eval cases used namespace-prefixed tags ("public_private.repo_facts", "release.push") that match no authority's literal text and are significant (medium risk or external target), so the kernel correctly routed them as first-impression (CourtRequired) under the settled rule. The eval, not the kernel, was out of step: a significant act WITH an on-point governing authority is conditioned, not first-impression. The safe direction for routing to drift is stricter and fail-closed, and it did.

DIRECTIVE	ACTOR	MUST
D1	lexby	correct the two route eval cases to tag each input with a governing authority substring so they test the real allowed with conditions path
D2	lexby	preserve dec 006 no semantic matching the kernel routing is not amended

FORBIDDEN
softening dec 006 to match a dotted domain tag semantically without a recorded amendment
loosening the eval expectation to allowed with conditions for a tag that matches no authority

Kernel routing is correct under DEC-006; the eval used tags matching no authority. Corrected the eval to governing-authority tags; the suite is green. No semantic matching; the kernel is not amended.
