IN THE MATTER OF

*1. Was the completed merge of PR #1 into the development repository master branch lawful?
2. Did the queued self-hosted constitutional review runs need to finish before merge? 3. Was
it lawful to cancel the queued runs after merge? 4. Does filing this review require a further
review of the review?*

Before:

Coade J, Sumberly J, Marsden J

Date: **6 June 2026**

REQUEST FOR RULING

JUDGMENT

REASONS

1. The practical problem was an infinite loop risk. If every post-merge review required a new PR, and that PR then required another post-merge review, the Agent Loop would stop being a loop of authority and become a procedural trap. Bill 31 requires proportionate review, not recursion for its own sake.
2. [2026] REALM-PC 22 settled the main point. Development preparation and movement through origin are different from canonical public VJS publication. The public-release warrant machinery is strict at the public edge, but it does not convert every private or development movement into a public release.
3. The merge itself was careful. The branch was clean. The PR was marked ready. GitHub reported it as mergeable. Local VJS CI passed. The queued self-hosted clerk run did not complete because no self-hosted runner took the job. Where the repository merge endpoint allowed the merge and no required-rule evidence was available through CLI, the agent was entitled to proceed under PC22 and the local gate.
4. The later cancellation of the queued runs was also ordinary cleanup. A queued review of an old PR head, after the PR is merged, is not a live merits decision and does not need to remain as a permanent ambiguous queue item.

DISPOSAL

1. The merge of PR #1 into the development repository master at merge commit [commit] is approved.
2. The merge did not require a public VJS release warrant.
3. The local VJS gate passed before and after merge.
4. Cancelling queued workflow runs [run] and [run] after merge is approved.
5. Filing this review and pushing it to the development remote after cdd local-ci and cdd release-warrant pass is authorised as ministerial close-out.
6. No further post-merge review is required for this review absent a new defect, failed gate, non-development public route, or canonical public VJS publication.
7. The matter does not climb. No conflict with Supreme Court authority appears.

APPENDIX A - RECORD ACCEPTED

8. | Item | Finding |
9. |---|---|
10. | PR | [development repository PR #1] |
11. | PR state | closed and merged |

- 12. | Merged at | 2026-06-08T07:23:04Z |
- 13. | Merge commit | [commit] |
- 14. | Head branch | [development branch] |
- 15. | Head SHA | [commit] |
- 16. | Base branch | master |
- 17. | Development remote | origin, [development repository] |
- 18. | Public VJS remote | not touched |
- 19. | Local gate | cdd local-ci --json passed after merge |
- 20. | Release-warrant retrieval | cdd release-warrant found no public VJS warrant
required for origin / master at the merge commit |
- 21. | Cancelled queued runs | [run], [run] |

1. The merge of PR #1 into the development repository master was a development-repository merge, not a public VJS canonical publication. It did not push to upstream or to <https://github.com/wlilley93/vibe-justice-system.git>. 2. The merge used CLI action routing within the meaning of Bill 31 and [2026] REALM-PC 22. The PR was marked ready with gh; merge posture was inspected with gh; the merge was performed with gh pr merge; local master was fast-forwarded with git; and the feature branch was pruned with git. 3. The required local VJS gate was satisfied. cdd local-ci --json passed before the merge and again after local master fast-forwarded to merge commit [commit]. 4. The push-licence retrieval requirement was satisfied. cdd release-warrant reported that origin / [development repository] did not require a public VJS release warrant for the development master ref. That output is evidence of route posture, not legal force in itself. 5. The self-hosted GitHub Actions constitutional review runs did not bar the merge on this record. They remained queued because the workflow requires a self-hosted runner. The repository accepted the merge, and there is no evidence that a required branch protection rule was bypassed. Branch-protection and ruleset read endpoints were unavailable to the CLI token, so the agent correctly let the GitHub merge endpoint enforce any live platform rule. 6. Cancelling the queued workflow runs after merge was lawful. They were queued against old PR heads, not running, not completed merits reviews, and no longer capable of gating the already-completed merge. Cancellation avoided stale post-merge ambiguity and did not alter the legal source of the merged content. 7. Filing this post-merge review is the close-out for the development merge. Its development-remote push may be made directly by git after cdd local-ci and cdd release-warrant pass. A further post-merge review of this review is not required unless a gate fails, a new material defect appears, a non-development public route is used, or canonical public VJS publication is attempted. 8. This ruling does not authorise public VJS publication. Any future push to the canonical public VJS remote remains subject to [2026] REALM-SI 7 and must retrieve and match the applicable release warrant before the outward act.

GOOD-LAW
