BINDING

 · assent: standing bounded assent · subject: governance.repository-topology

3-0 Privy Council ruling consolidating onto established public repo as one canonical line with two-estate Gazette.

V2 Privy Council, 3-0. The canon consolidates onto the established public repository as the one canonical line (T1): canon on main, the repository name dropping the spent "v2" ordinal (Q6) with an inbound redirect; T2 and T3 rejected (T2 inverts canonicalisation and forfeits the public Gazette; T3 leaves two canonical lines and splits the single-Gazette graph, contrary to s.16). The V1 Archive estate is anchored by an immutable signed tag, exposed via a protected read-only v1 branch and a distinct published Archive directory; a bare branch is too weak a vehicle for an estate. One Gazette on the canonical line carries both estates including V1 archival law so the citation graph resolves in one place; V1/REALM records carry machine-readable estate markers (estate v1_archive, status archival_source_only, live_authority false); a citation to a V1 source is a source edge, not an authority edge; V1 binds only by incorporation (s.8/s.9). The destination is settled now but the physical migration is STAGED behind a governed, lock-preserving instrument and halts and returns if path-continuity and invariant-scoping cannot be proven.

DIRECTIVE	ACTOR	MUST
D1	standing_committee	codify topology in the framework act and raft as void first drafts
D2	agent	treat v1 records as archival source only with estate markers and source edges
D3	agent	perform any repo migration only as a governed lock preserving staged act

FORBIDDEN
keeping two canonical lines or splitting the single gazette graph
resting the v1 archive estate on a bare movable branch
a mass edit or blind move that breaks the lock or fail opens a path scoped invariant
treating a v1 source citation as an authority edge or v1 archival law as live

Consolidate onto the established public repo as one canonical line (canon on main; drop the "v2" name with a redirect). The V1 archive is an immutable-tag- anchored, protected, read-only estate rendered as a distinct Archive directory, not a bare branch. One Gazette carries both estates incl. V1 archival-source- only law; the graph resolves in one place; V1 citations are source edges, not authority edges; V1 binds only by incorporation. The destination is

settled now; the byte-move is staged behind a governed, lock-preserving instrument (no mass edit; preserve paths or redirect; prove each fatal invariant still binds; fresh lock under a commencement addendum, old lock pinned) and halts if continuity cannot be proven. The Committee is directed to codify in the Framework Act + raft.
